Isolated and purified cysteine rich protein 61, Cyr61 - useful to modulate e.g. haematostasis, induce wound healing, promote organ regeneration etc.

Claim 2; Page 112-113; 133pp; English.

This protein sequence comprises human cysteine rich protein 61 (Cyr61), an extracellular matrix signalling molecule. Its amino acid sequence was deduced from a human placental cDNA clone (see AA79469). Cyr61 cyr61 can be expressed in transformed or transfected host cells. Cyr61 can be used to modulate heematostamis, induce wound healing in a tissue, prochesis implantation, improve tissue graffing or promote for a modulator of angiogeneration, into a also be used to screen for a modulator of angiogenesis, chondrogenesis, oncogenesis, cell adhesion, cell migration, cell proliferation, expand a population of undifferentiated haematopoietic stem cells in culture and to screen for a

The invention relates to extracellular matrix (ECM) signalling molecules involved in cellular response to growth factors. More particularly the involved in cellular response to growth factors. More particularly the involved in directed to cysteine-rich protein (Cyr61), and Cyr61-related proteins such as fibroblast secreted protein (Fispl2) and connective tissue growth factor (CTGP) and nucleic acid molecules encoding such proteins. The polypeptides of the invention are members of cysteine-rich secreted protein family. Human Cyr61 fragment is useful in methods for screening modulators of cell adhesion, cell migration, fibroblast cell prolaferation, angiogenesis, wound healing and Cyr61-integrin receptor interaction. Modulator of Cyr61-integrin alphavbeta3 interaction is used for the preparation of a medicament for the treatment of atherosclerosis, heart disease, tumour mecastasis, fibrosis, tumour growth, disorders associated with inadequate angiogenesis, aberrant granulation tissue development, abstrant fibroblast growth, and wounds. Polymcleotides of the invention are useful in gene therapy. The present sequence is human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

ô The present sequence represents a monocyte mature differentiation factor (MMDF) which maintains the life of macrophages for long periods in liquid culture. MMDF can be used as an anti-cancer agent, an immune activator and to treat infectious diseases 120 9 9 1 MSSRIARALALVVTLIHLTRIALSTCPAACHCPLEAPKCAPGVGLVRDGCGCCKVCAKQL 1 MSSRIARALALVVTLLHLTRLALSTCPAACHCPLEAPKCAPGVGLVRDGCGCCKVCAKQL NEDCSKTOPCDHTKGLECNFGASSTALKGICRAQSEGRPCEYNSRIYQNGESFOPNCQHQ Gaps term Human; monocyte; mature; differentiation factor; MMDF; macrophage; cancer; immune activator; tissue culture; infectious disease. - useful for the long ö Length 381; Indels Match

The method comprises increasing the level of Cyfol in leiomyoma tissue. The invention also describes compounds and compositions that stimulate induction of the Cyfol gene and compounds that increase Cyfol activity. The compositions and the method of the invention are useful for preventing uterine leiomyoma formation or inhibiting proliferation of uterine leiomyoma in a subject. The method is particularly useful for treating or preventing uterine leiomyoma in a subject. The present sequence represents human Cyfol. Note: The present sequence represents human Cyfol. Note: The present sequence sequence order in the figure. The start of the sequence is shown on page 8/10 of the figures and the rest of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

The present invention describes a method for the prevention or inhibition of breast cancer cell proliferation. The method comprises administration of breast cancer cell proliferation. The method comprises administration of of a compound that inhibits the interaction of a sex steroid receptor with a sex steroid response element of the Cyfel (cysteine rich heparinbinding protein) promoter. Cyfel has cytostatic activity. An antibody (I) which neutralises Cyfel can be used to prevent or inhibit breast cancer cell proliferation by blocking sex steroid induced and growth factor in equivalently of the cyfel DNA, where the growth factor is epidermal, consist in binding epidermal or basic fibroplastic growth factor. (I) can be used to diagnose or stage breast cancer where the level of Cyfel in a costive/suspect breast cancer where the level in normal cost in an increase in the level of Cyfel compared to the level in normal tissue indicates the presence of breast cancer. The level of Cyfel being determined by exposing the tissues to (I), and an increase in the level coff bound antibody by the suspect/postive cell as compared to the normal tissue indicates the presence of breast cancer. The present sequence represents the human Cyfel protein, which is used in the exemplification control of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Regulation of Cyr61 expression and activity for preventing and inhibiting breast cancer comprises use of a Cyr61 neutralizing antibody, an antisense oligonucleotide and an antibody which.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, Cyr61; breast cancer; sex steroid receptor; cytostatic; promoter; sex steroid response element; cysteine rich heparin-binding protein; cell proliferation; heparin binding epidermal growth factor; epidermal growth factor;
2106; DB 5;

The present invention relates to a method for stimulating angiogenesis in a mammal. The method comprises administering a polynucleotide encoding connective tissue growth factor-2 (CTGP-2) or an active fragment or its derivative. The method is useful for stimulating angiogenesis in a mammal preferably human having ischaemia or restenosis or is treated for limb revascularisation which is leg or arm. The invention is useful for inhibiting tumour growth, where anglogenesis is utilised for enhancing the repair of connective and support tissue, promoting the attachment, fixation and stabilisation of tissue implants and enhancing wound healing, hence is useful for treating cardiovascular disease e.g. atherosclerosis, reperfusion injury such as heart failure, angina, atherosclerosis, reperfusion injury such as heart failure, angina, schaered, or regeneration of itssues which is utilised to repair replace or protect tissue damaged by congenital defects, trauma (burns, culcer, etc.), age, disease (e.g. osteoprosis, periodontal disease, liver failure), surgery including cosmetic plastic surgery. The present sailure, surgery including cosmetic plastic surgery. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NEDCSKTOPCDHTKGLECNFGASSTALKGICRAQSEGRPCEYNSRIYONGESFOPNCOHO 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the isolation of human connective tissue growth factor 2 (CTGF-2), and the polyuncleotide sequence encoding it. The CTGF-2 polypeptide is useful for enhancing the repair of connective and support tissues, for treating skin disorders such as injuries, acne, IV damage or burns, and wrinkled skin, for promoting attachment, fixation and stabilisation of tissue implants, and as an immunogen to produce antibodies. The polyuncleotide sequence encoding CTGF-2 may be used as a hybridisation probe for a cDNA library to isolate the fill-length cDNA and other cDNAs, which have high sequence similarity to the CTGF-2 gene or similar biological activity. The polynucleotides are also useful for identification. The present sequence represents human CTGF-2. Note: The present sequence represents human CTGF-2. Note: The present sequence listing differs from that given in Fig 1 (ABU63223)

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB4239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities
                                                                                                                                                                              180

The invention discloses the isolated human polypeptides, and polymerides encoding them, that have been designated SECX and NOVX. The polymerides can be used for treating, or delaying, the onset of an angiogenic-associated disorder or treating a pathological state in a subject, preferably a mammal. They can also be used in determining the presence of, or predisposition to, a disease associated with altered levels of the polypeptides and polymerications or sequences (SEC1-12), for raising antibodies, for identifying an agent that modulates the expression or activity of the polypeptide, for treating or preventing a NOWX-associated disorder (NOVI-8) and as a pharmaceutical composition comprising the polypeptide, or the antibody. The polypeptides and polymeleotide or the antibody. The polypeptides and polymeleotide or the antibody. The polypeptides and polymeleotides the antibody. The polypeptides are useful in diagnostic applications where their amounts are assessed, or preventing disorders or syndromes such as developmental disorders, immune diseases, signal transduction pathway disorders, metabolic disorders, neurodegenerative disorders (including Alzheimer's disease and parkinson's disease, including obesity), wasting disorders as that of a protores (including Alzheimer's disease and parkinson's disease, cirrhosis, diabetes, infectious disease (bacterial, fungal, protozoal and viral e.g. human immunodeficiency virus, HIV), cancer (e.g. prostate cancer), hypertension, hypotension, multiple cancers, urinary retention, osteoporosis, Crohn's disease, user, for a meniogene te produce antibodise specific for the murching as immunogene to produce antibodise specific for the murching as immunogene to produce antibodise specific for the munical and sease and multiple stations and seasons and such as a such and the seasons and such and seasons and such and such as such and seasons and such as suc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human SECX/NOVX polypeptide useful for diagnosing, preventing or treating disorders associated with aberrant expression or activity of SECX/NOVX nucleic acids and proteins e.g., diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Zhong H;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
patient sample and the normal level of expression of the marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer. Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequence given in ABB75177-ADB75631 represent marker cDNA and proteins. Note: The sequence was obtained in electronic format directly from WIPO at fit pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ઠે
                                                                                                                  The present invention describes human small CCN-like growth factor (SCGF). SCGF has vulnerary and osteopathic activities, and can be used in gene therapy. The SCGF polypeptides and polymucleotides can be used for treating muscle wasting diseases, and polymucleotides can be used for wound healing and tissue regeneration, to promote angiogenesis and to stimulate proliferation of vascular smooth muscle and endothelial cell production. The present sequence represents a CNN family protein which is given in comparison with the human SCGF in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                   120

The GTGF polypeptides are structurally and functionally related to a family of growth factors which include IGF (Insulin-like growth factor), PDGF (platelet-derived growth factor), and FGF (fibroblast growth factor). CGF-2 exhibits 89 percent identity and 33 percent similarity to CTy61. Cry61 is a growth factor-inducible immediate early gene initially identified in serum-stimulated mouse fibroblasts. It encodes a member of an emerging family of secreted proteins which are also a group of cysteine-rich proteins. This group of Grysteine-rich proteins. This group of Grysteine which are important for normal growth, differentiation, morphogenesis of the cartilaginous skeleton of an embryo and cell growth. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 MSSRIVRELALVVTLLHLTRVGLSTCPADCHCPLEAPKCAPGVGLVRDGCGCCKVCAKQL

CTGF-2 cDNA was isolated from a cDNA library derived from human foetal lung. In one instance, the cDNA was cloned into a baculovirus expression vector, having first ben amplified and modified via PCR using primers AAZ11721 and AAZ11722. In another instance, the cDNA was cloned into a cOS cell expression vector, with prior amplification and modification using PCR primers AAZ11723 and AAZ11724. CDRA was cloned modification using PCR primers AAZ11723 and AAZ11724. CDRA was cloned modification using PCR primers AAZ11723 and AAZ11724. CDRA-2 is structurally and functionally related to a family of growth factor) and FCR (insulin-like growth factor). PDGF (platelet-derived growth cattor) and FCR (insulin-like growth factor). This emerging family of orgation-rich secreted proteins are important for normal growth. CC datterniation, morphogenesis of the cartilaginous skeleton of an embryo configuration, morphogenesis of the cartilaginous skeleton of an embryo be used to enhance the repair of connective tissue and support tissue and call growth the response the repair of connective tissue and stabilization of tissue implants inserted during reconstructive surgery, and can be read to promote the attachment, fixation and stabilization of tissue implants inserted during reconstructive surgery, and can be read to enhance the healing of external wounds. It can be used in the treatment of injured or depleted bone as it promotes the growth of connective tissue, bone and cementum and stimulates protein and collagen

a mammal. The method comprises administering a polynucleotide encoding connective tissue growth factor-2 (CTGF-2) or an active fragment or its connective. The method is useful for stimulating angiogenesis in a mammal preferably human having ischaemia or restenosis or is treated for limb revaccularisation which is leg or arm. The invention is useful for inhibiting tumour growth, where angiogenesis is cutilised for enhancing the repair of connective and support tissue, promoting the attachment, fixation and stabilisation of tissue implants and enhancing wound healing, hence is useful for treating cardiovascular disease e.g. atherosclerosis, reperfusion injury such as heart failure, angina, schemana, and is also used to differentiate, proliferate and attract cells leading to regeneration of tissues which is utilised to repair replace or protect tissue damaged by congenital defects, trauma (burns, close, etc), age, disease (e.g. osteoporosis, periodontal disease, liver failure), surgery including cosmetic plastic surgery. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence 2, Application US/09582337

patent No. 656268

Sequence 2, Application US/09582337

patent No. 656268

GENERAL INPORMATION:

TITLE OF INVENTION: Monoclonal Antibody Against Connective Tissue Growth Factor

TITLE OF INVENTION: and Medicinal Uses Thereof

TITLE OF INVENTION: and Medicinal Uses Thereof

FILE REFERENCE: J1-009PCT

CURRENT APPLICATION NUMBER: US/09/582,337

CURRENT FILING DATE: 1997-12-25

PRIOR FILING DATE: 1997-12-25

PRIOR FILING DATE: 1998-12-15

SOFTWARE: PRIOR FILING DATE: 1998-12-15

SOFTWARE: PATENT OF USE: 1208-12-15

SOFTWARE: PATENT OF USE: 1208-12-15

SEQ ID NO: 27

REACION WITH Integrin alpha vbeta S and enhances mitogenesis through integrin alpha vbeta S and enhances mitogenesis through integrin alpha vbeta I independent of its carboxyl-terminal domain.";

J. Biol. Chem. 276:21943-21950(2001).

C. -- FUNCTION: Promotes cell proliferation, chemotaxis, angiogenesis and cell adhesion. Appears to play a role in wound healing by upcompleting, in skin fibroblasts, the expression of a number of genes involved in angiogenesis, inflammation and matrix remodeling including VEGA-A, VEGA-C, MMP1, MMP3, TIMP1, uPA, PAI-1 and integrins alpha-3 and alpha-5. Cyrel-mediated gene regulation is dependent on heparin-binding through integrin alpha-6/beta-1, adhesion and adhesive signaling through integrin alpha-Vbeta-5 and cell type-decretion through integrin alpha-Vbeta-5.

C. -- SUBNITE: Interaction with integrin is heparin- and cell type-decretion with integrin is heparin- and cell type-decretion with integrin in through integrin is heparin- and cell type-decretion with integrin is heparin- and cell type-decretion with integrin in through integrin is heparin- and cell type-decretion with integrin is heparin- and type-decretion with integrin is heparin- and cell type-decretion with integrin is the parin- and type-decre
